Summary of ECG Report

Based on the ECG report for Jamil Parkar, here are the key findings and what they might indicate:

Heart Rate (VR): 66 bpm
This is within the normal resting heart rate range for adults (60-100 bpm).

QRS Duration (QRSD): 98 ms
This is within the normal range (less than 120 ms), indicating normal ventricular depolarization.

QT Interval (QT): 372 ms
This is within the normal range for men (generally less than 440ms, though the exact upper limit depends on heart rate and other factors), indicating normal ventricular repolarization.

Corrected QT Interval (QTcB): 390 ms
This is also within the normal range, which is important for assessing the risk of arrhythmias.

PR Interval (PRI): 220 ms
This is slightly prolonged (normal is 120-200 ms), which might indicate first-degree atrioventricular block. This condition is usually benign but should be monitored.

P-R-T Angles: 33° NA 4°
These angles provide information about the electrical axis of the heart. The values show a deviation from normal, which warrants further clinical evaluation in conjunction with other diagnostic data. Further information is needed to fully interpret this.

Summary:
The ECG report shows mostly normal findings for Mr. Parkar, with a slightly prolonged PR interval suggesting a possible first-degree AV block. The P-R-T angles also show deviation from the norm. Given that a complete clinical picture is needed, these findings should be reviewed by a healthcare provider in conjunction with the patient's medical history and other test results to determine their significance.
