

Patient ID: 1328747

Patient Name: Marina Krishnakumar

Age / Gender: 59/Female

Date: 20th Dec 24 9:44 AM

Summary of ECG Report

Based on the ECG report for Marina Krishnakumar, here are the key findings and what they might indicate:

Heart Rate (VR): 73 bpm

This is within the normal resting heart rate range for adults (60-100 bpm).

QRS Duration (QRSD): 98 ms

This is within the normal range (less than 120 ms), indicating normal ventricular depolarization.

QT Interval (QT): 388 ms

This is within the normal range for women (values vary based on age and other factors, generally less than 440ms), indicating normal ventricular repolarization. Further assessment considering her age and other clinical factors may be needed.

Corrected QT Interval (QTcB): 426 ms

This value is near the upper limit of the normal range. While generally considered within normal limits, it's important to consider this in conjunction with other factors and the patient's medical history. Slightly prolonged QT intervals can

increase the risk of certain arrhythmias.

PR Interval (PRI): 156 ms

This is slightly prolonged (normal is 120-200 ms), but it's close to the upper limit of normal. Further observation or additional testing may be warranted to monitor any potential changes. It does not necessarily indicate a pathological condition.

P-R-T Angles: 61° NA 43°

These angles provide information about the electrical axis of the heart. The values here are within normal limits.

Summary:

The ECG report for Marina Krishnakumar shows mostly normal findings. The QTcB is nearing the upper limit of normal and the PR interval is slightly prolonged, warranting further observation and correlation with clinical findings. A healthcare professional should interpret these results in the context of her complete medical history and other diagnostic tests.
