

Patient ID: 1311828

Patient Name: Jamil Parkar

Age / Gender: 71/Male

Date: 7th Jan 25 11:47 AM

Summary of ECG Report

Based on the ECG report for Jamil Parkar, here are the key findings and what they might indicate:

Heart Rate (VR): 66 bpm

This is within the normal resting heart rate range for adults (60-100 bpm).

QRS Duration (QRSD): 98 ms

This is within the normal range (less than 120 ms), indicating normal ventricular depolarization.

QT Interval (QT): 372 ms

This is within the normal range for men (generally less than 450ms, though the exact upper limit depends on factors like age and heart rate), indicating normal ventricular repolarization.

Corrected QT Interval (QTcB): 390 ms

This is also within the normal range, which is important for assessing the risk of arrhythmias.

PR Interval (PRI): 220 ms

This is slightly prolonged (normal is 120-200 ms), which might indicate first-degree heart block. This condition is usually benign but should be monitored.

P-R-T Angles: 33° NA 4°

These angles provide information about the electrical axis of the heart. The values here are within normal limits, although the large difference between the two measurable angles might warrant further investigation.

Summary:

The ECG report shows mostly normal findings for Mr. Parkar with a slightly prolonged PR interval, which might indicate a first-degree heart block. The significant difference in the P-R-T angles should also be noted and requires further evaluation. This condition is generally not serious but should be monitored by a healthcare provider. Further investigation may be warranted based on clinical presentation and other diagnostic tests.
