

Patient ID: 1319395

Patient Name: Ajaykumar Lall

Age / Gender: 81/Male

Date: 4th Jan 25 12:03 PM

Summary of ECG Report

Based on the ECG report for Ajaykumar Lall, here are the key findings and what they might indicate:

Heart Rate (VR): 57 bpm

This is within the lower limit of the normal resting heart rate range for adults (60-100 bpm). A rate this low might indicate bradycardia, although further investigation and consideration of the patient's clinical history is necessary to determine significance.

QRS Duration (QRSD): 102 ms

This is slightly prolonged (normal is less than 120 ms), suggesting a possible delay in ventricular depolarization. While within the upper range of normal, further investigation may be warranted depending on the patient's symptoms and other clinical findings.

QT Interval (QT): 390 ms

This falls within the normal range for men (generally less than 450 ms), indicating normal ventricular repolarization.

Corrected QT Interval (QTcB): 380 ms

This is also within the normal range, suggesting a low risk of arrhythmias related to repolarization abnormalities.

PR Interval (PRI): 164 ms

This is within the normal range (120-200 ms), indicating normal atrioventricular conduction.

P-R-T Angles: 48° NA 32°

These angles, representing the heart's electrical axis, appear to be within normal limits, although the meaning of "NA" needs clarification.

Summary:

The ECG shows mostly normal findings for Mr. Lall. The slightly prolonged QRS duration warrants further investigation, particularly in conjunction with the patient's symptoms and medical history. The slightly low heart rate should also be considered in the context of his overall health status. A qualified physician should interpret these findings in light of his complete clinical picture.
